- K-fold data split
  - ✓ Entire data is split into k blocks; each classifier is trained only on different subset of (k-1) blocks
- Final output

$$\hat{y} = \delta \Big( f_1(\mathbf{x}), f_2(\mathbf{x}), \cdots, f_{k-1}(\mathbf{x}), f_k(\mathbf{x}) \Big)$$

 $\checkmark \delta(\cdot)$ : An aggregation function of individual outputs (ex: simple average)

Breiman (1996)

#### • Main Idea

- ✓ Each member of the ensemble is constructed from a different training dataset
- ✓ Each dataset is generated by sampling from the total N data examples, choosing N items uniformly at random with replacement
- ✓ Each dataset sample is known as a bootstrap

- Result Aggregating: Stacking
  - ✓ Use another prediction model to aggregate the results
    - Input: Predictions made by ensemble members
    - Target: Actual true label

- Result Aggregating: Stacking
  - √ The winner of KDD-cup 2015
    - MOOC dropout prediction

#### Bagging: Algorithm

# Algorithm 1 Bagging Input: Required ensemble size TInput: Training set $S = \{(x_1, y_1), (x_2, y_2), ..., (x_N, y_N)\}$ for t = 1 to T do Build a dataset $S_t$ , by sampling N items, randomly with replacement from S. Train a model $h_t$ using $S_t$ , and add it to the ensemble.

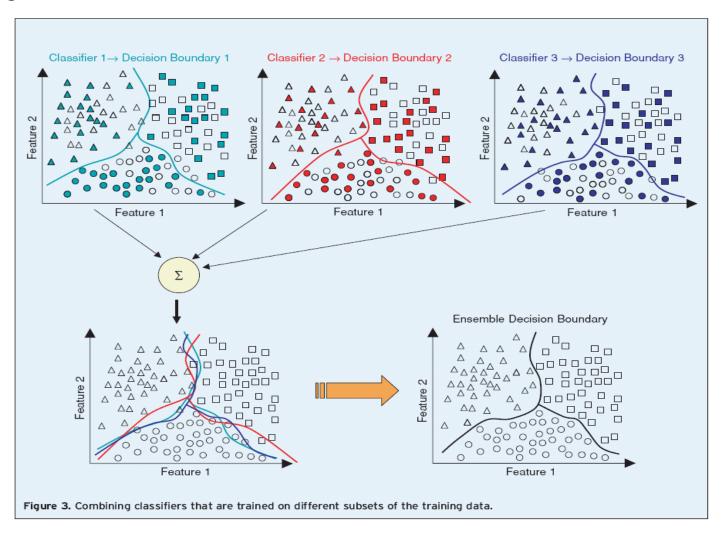

#### end for

For a new testing point (x', y'),

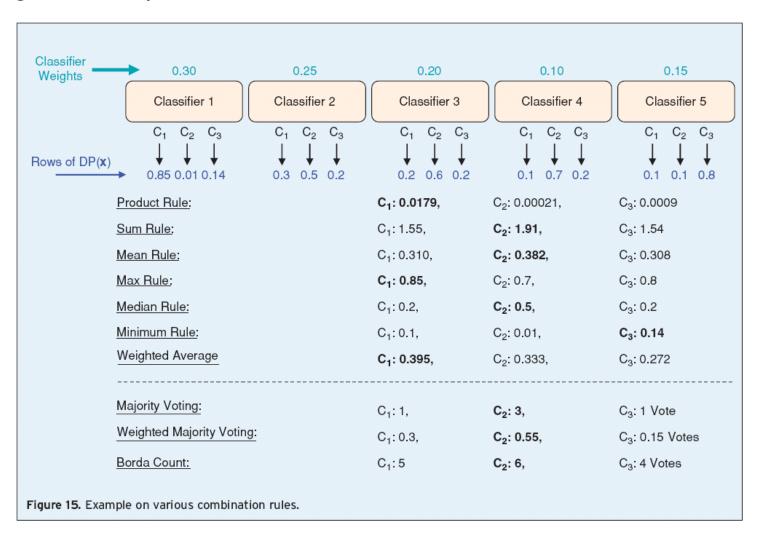

If model outputs are continuous, combine them by averaging.

If model outputs are class labels, combine them by voting.

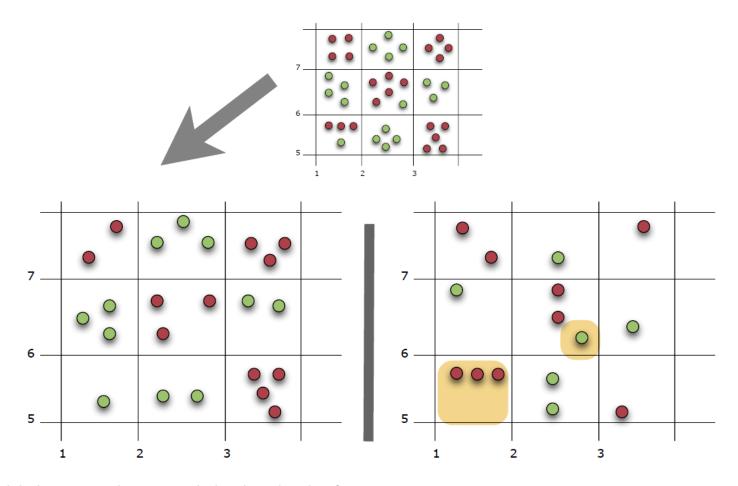

#### Bagging: Illustration

#### Aggregation examples

- Out of bag error (OOB Error)
  - ✓ Use the training instances that are not sampled for validation

Bagged Trees vs. Single Tree
